

PRESS RELEASE 20th Sept 2010 – for immediate release

EQUINE PLATELET ENHANCEMENT THERAPY

- **the new name for the fPRP System from VetCell**

E-PET (Equine Platelet Enhancement Therapy) is the new name for Pall's fPRP System distributed by VetCell worldwide. E-PET uses filter-based technology to provide equine veterinary surgeons with a quick and easy way of obtaining sterile, autologous, platelet-rich concentrate in the field or the clinic.

E-PET concentrate is used to promote wound, bone healing and ligament/tendon repair. In wounds it accelerates epithelial differentiation and produces well organised tissue to enhance wound healing, especially in problematic lower limb injuries in horses.

The E-PET system, developed by Pall Corporation, is the only platelet concentration device that does not require a centrifuge. This simple, disposable kit uses gravity filtration to gently prepare an autologous platelet concentrate in just 10-15 minutes.

Full details of E-PET are available on the VetCell website. A new VetCell website is currently under construction so E-PET will soon be available to buy direct from the website to benefit from an online discount. There are also further discounts available for buying more than one kit at a time.

For more information on VetCell and E-PET or to obtain logos and images please contact:
